### **Green National Accounts for Denmark**

*Ole Gravgård Pedersen, Ingeborg Vind (Danmarks Statistik)*

Statistics Denmark is currently (2015-2017) working on a project to expand and develop the Environmental-Economic Accounts for Denmark under the heading 'Green National Accounts'. This presentation will explain what the green national accounts are, including how they are different from the 'green GDP'. The green national accounts are designed to facilitate integrated analysis of the economy and the environment, combining information in physical and monetary terms and compiled according to an international statistical standard - the System of Environmental-Economic Accounting 2012 – Central Framework (UN et al., 2014). The presentation will include examples from different parts of the accounts, both existing and forthcoming, including water, materials and waste, energy and emissions, natural resources and the 'green economy'.
