

Recreational values of forests

Authors and affiliation: Jette Bredahl Jacobsen, Lasse Læbo Matthiesen, Thomas Lundhede & Hans Skov-Petersen; University of Copenhagen

Based on stated travel distances among a random sample of the Danish population, we estimate recreational values of forests, using a multi-site recreational model, i.e. taking into consideration substitute sites. A number of modelling choices differ from earlier studies conducted in Denmark. In particular the definition of a recreational site and controlling for house site selection. We use this to discuss the importance of researcher defined choices, and thereby potential biases in revealed preference methods.
